

off the fence.

Vanishing Planet

2 x 60'

EPISODIC BREAKDOWN

1. Lost at Sea

Madagascar is one of the priority biodiversity hot spots on our planet. Despite devastating erosion throughout this thousand mile long island, Madagascar remains one of the planet's richest biological settings, offering insights into evolution, and encounters with species made aware by laws as well as moments of unparalleled beauty. But today, less than 10% of Madagascar is still in its natural state.

2. Future Shock

Madagascar reminds us that the world was once a purer, wilder place full of mystery and magnificence. Today, a single species, large of brain, possessed of technology, has rapidly swarmed almost every environmental niche of the globe and dramatically altered the biosphere. And while the future presents no guarantees, Madagascar, like all hot spots, continues to be a living laboratory.
